Alan Ellis, Edward. Tutor (CITRO, Mexico)

INTRODUCTION

The objective of the Isthmus of Tehuantepec Interoceanic Corridor (CIIT) is to improve the connectivity of this area and the supply of services, reduce costs and times for the transport of goods, and insert the isthmus into the global network of transport and logistics systems (Torres Fragoso 2022).
Environmental perceptions in Mexico are scarce and can be traced back to the relationship between man and his environment. The few studies that are carried out on environmental perception are. Therefore, the few studies that are carried out on environmental perception are approached from psychology, anthropology and geography (Fernández Moreno Yara, 2008).
Environmental policies in Mexico reflect the perceptions, visions and interests of those who believe them rather than those of the local population, a situation that has an impact on the failure or success of a program or public policy (Fernández Moreno, 2008). Hence the need to carry out studies of environmental perceptions, considering social actors who can contribute to improvement, community planning designs and even environmental or local development policies (Tavares-Martínez, Fitch-Osuna, 2019).

OBJECTIVE

To determine the socio-environmental perception of the actors related to the development of the CIIT project, Ubero-Mogoñe Section in Oaxaca.

HYPOTHESIS

It is considered that the greater the presence of social actors with particular characteristics in a socially vulnerable group, the greater the degree of success of collaborative community planning.

FACTS

-Beneficiary population of the CIIT: 1,200,000 inhabitants located in 76 municipalities of Oaxaca and Veracruz, where 788 urban localities are located. Around 11,884 are indigenous households and 104,000 people live in highly marginalized conditions (Candelas Ramírez, 2019).
-Ethnic composition of the Isthmus of Tehuantepec: In the Oaxacan Isthmus, 57% of the population considers itself indigenous, although only 30.4% fluent in an indigenous language, the ethnic groups are the following: Zoque, Zapotec, Tzotzil, Mixe, Chinantec, Mixtec, Mazatec, Chocholteco groups, they are located in both Oaxaca and Veracruz; while the Chontal and Huave are only in Oaxaca; while Nahuatl and Popoluca are only present in Veracruz.
-There were only 07 regional assemblies with representatives of indigenous communities on the development of the project and consultation with the native peoples of the Oaxaca region, in accordance with uses and customs, on March 30 and 31, 2019.
-More than 700 community demands were detected that will be considered into the Program.

DATA AND METHODOLOGY

The study is influenced by previous literature (Fernández Moreno Yara, 2008; Tavares-Martínez & Fitch-Osuna, 2019; Básicos & Aplicación, n.d.) and will rely on survey data collected by the author.

-Identification of social actors: to obtain information from the actors, surveys or interviews will be used to build the profiles of the social actors. Similarly, the levels of power or influence will be identified according to the same surveys or interviews .

-Socio-demographic data: Age, income, education and social class, land tenure, as well as sex, ethnicity, language and religion.

Then, a Socio-Environmental Perception Index is going to be constructed. Additionally, I proposed to perform some network analysis, a tool that will help us in the observation, description and understanding of socio-environmental interactions.

PRELIMINARY RESULTS

-Several complaints from communities about the omissions, errors, concealment of information from one of the Social Impact Statements (MIA), about the possible effects on the fauna and flora and possible evictions of inhabitants that the work will generate.
Observations from socioeconomic information
-The CIIT assemblies were attended by 2,417 people in the communities of Santiago Laollaga, Salina Cruz, Jaltepec de Candoyac, San Pedro Huamelula, Santa María Chimalapa, Oteapan, and Uxpanapa (Binational Infrastructure Conference, 2019).

PRELIMINARY RESULTS

-The construction of industrial parks, with highly polluting activities, put in risk the community life that was sustained by nature of its territory. Also, there is the fear that under a more industrialized environment and less nature diversity, there is increased risk over food security and low-valued manufacturing that perpetuates cheap labor.
-Socio-environmental conflicts delayed Section 2 of CIIT: Blockades of communities are led mainly by an organization in the area called UCIZONI, which makes social demands and promotes constant blockades. These demands are not in the possibility of being solved by the Isthmus of Tehuantepec Railway (FIT), however, the specialized area of the CIIT is responsible for channeling each unit for attention.

PRELIMINARY CONCLUSIONS

With this project, the risk of community division, erosion and privatization of social property is very high. Once communal or ejido land is rented or sold for any of these projects, there is no going back.
