

ADEQUATE HOUSING FOR INDIGENOUS TEENEK POPULATION

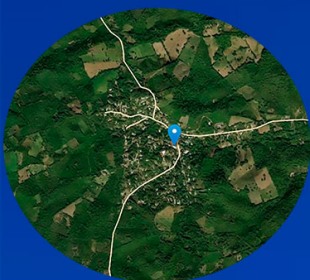

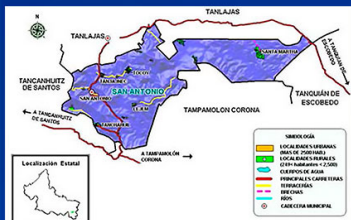

Inclusion of Indigenous Women to Postgraduate Studies

Programme, COPOCYT

Arq. Nancy Santiago Santos

BACKGROUND

Elderly Teenek Indigenous woman experience a number of challenges, including poverty, limited social security, abandonment and dispossession. Appropriate housing is also one of the most important problems they face. The dwelling occupied by the elderly woman from this indigenous group present issues related to quality and also to accessibility and functionality. As they also face challenges associated to age related dependency, physical health and fitness, inadequate housing affects their quality of life and their safety.

Santa Martha, San Antonio

348 female

RESEARCH QUESTION

What are the most relevant housing needs among elderly indigenous Teenek woman and how to adequate them to fulfil these needs?

METHODOLOGY

I used semi-structured interviews, collected visual evidence, and sketches to identify relevant issues experienced by the participants in the study. Five elderly indigenous women were interviewed in total recruited using purposeful sampling.

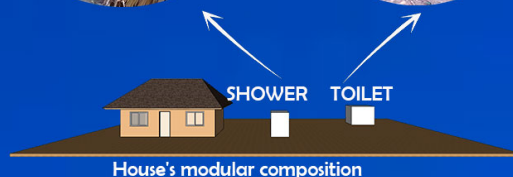

FINDINGS

The typical house follows a modular design, with rectangular shapes, and single storey. Kitchen and bedrooms are separated by dividers or the modular design.

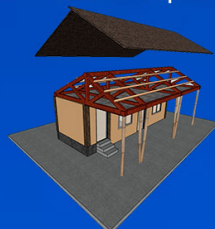

The house's design present inadequate features that make difficult fulfilling physiological needs related to food, sleep, good health, and sanitation.

I identified access to sanitation, disposal of human waste, emerged as particularly problematic.

Toilets are latrines external to the main building. They are located at the boundaries of the property to avoid odours. Uneven terrain in the property, lack of proper illumination, among other things make it unsafe for the elderly.

House's modular composition

Typical house structure

Typical material used in the region for building. The design presented here includes its use.

PALMA
(Sabal mexicana)

OTATEA
(Otatea
Acuminata)

CHIJOL
(Piscidia
communis)

PROPOSAL

I propose an intervention to facilitate access to sanitation.

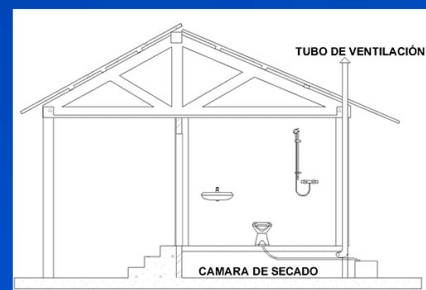

The design includes a modular toilet that can be appended to the main building.

The design includes the following features

- 1) Construction based on traditional methods using regional materials
- 2) Ecological dry toilet that prevents odours and allows for treatment of waste and produce compost.
- 3) Consideration of individual needs with an adaptable design

DRY TOILET

TOILET DESIGN

NEXT STEPS

- 1) Expand the sample to confirm priorities and further investigate individual needs
- 2) Refine the design of the toilet
- 3) Seek for collaborators for the project
- 4) Seek for funding
